

## General Description

GT-1612F5DR-AGGB is made of the MediaTek AG3335AT series GNSS chip, and six axis acceleration sensor. It is a multiple function communication module which has integrated the advanced online adaptive integrated navigation algorithm and GNSS location engine, it can provide real-time, high-precision vehicle location, speed measurement and direction measurement information in any environment (such as indoor, tunnel, underground garage, etc.). When the signal accuracy is reduced and even satellite signals are lost in GNSS system, without using the odometer information, GT-1612F5DR-AGGB can use only inertial navigation technology to locate, measure the vehicle carrier accurately for a long time.

GT-1612F5DR-AGGB is a concurrent receiver module with built-in multiple positioning systems that support simultaneous reception of GPS, Glonass, Galileo, Beidou, and QZSS L1 bands. It has 33 tracking channels, 72 capture channels and 210 PRN channels, enable it to capture and track any multiple satellite signals. Compared with single GPS system, the multiple positioning system (GPS & GLONASS & GALILEO & BEIDOU & QZSS & SBAS) of GT-1612F5DR-AGGB makes a great increase in the number of visible and available satellites, at the same time, the first positioning time is greatly reduced, even in complex urban environment, it can achieve higher positioning precision and accuracy.

### Applications

- Vehicle High Precision Navigation
- ITS (Intelligent Traffic System)
- Vehicle Remote Monitoring

**Figure: GT-1612F5DR-AGGB Top View**

### Features

- Build on high performance, low-power GNSS
- MediaTek AG3335AT chip set
- Built-in ST-LSM6DSRTR acceleration sensor to define various gravity algorithms
- Supports BDS-3 signals
- Simultaneously receiving multi-band multi-system satellite signals and all civil GNSS signals.
- Multipath signal detection and interference suppression.
- Passive or active antennas can be used
- Built-in high gain LNA to improve receiving sensitivity
- Software version : 20220707 L1+L5
- Support satellite systems:  
GPS, GLONASS, GALILEO, BEIDOU, QZSS, SBAS
- Ultra high track sensitivity: -167dBm
- Baud rate: 115200
- Protocol compliant NMEA-0183, MTK, RTCM3.3
- Automatically inertial navigation positioning without GNSS signal
- Automatically save GNSS log information
- Operating voltage: 2.8V~3.6V
- Power consumption: 70mA
- Product size: 16x12.2x2.6mm
- Package type: SMD with stamp hole
- Communication type: UART/TTL
- Recommended operating temperature : -40to85°C
- RoHS compliant (Lead-free)

# 1. Performance Description

## 1.1 Features

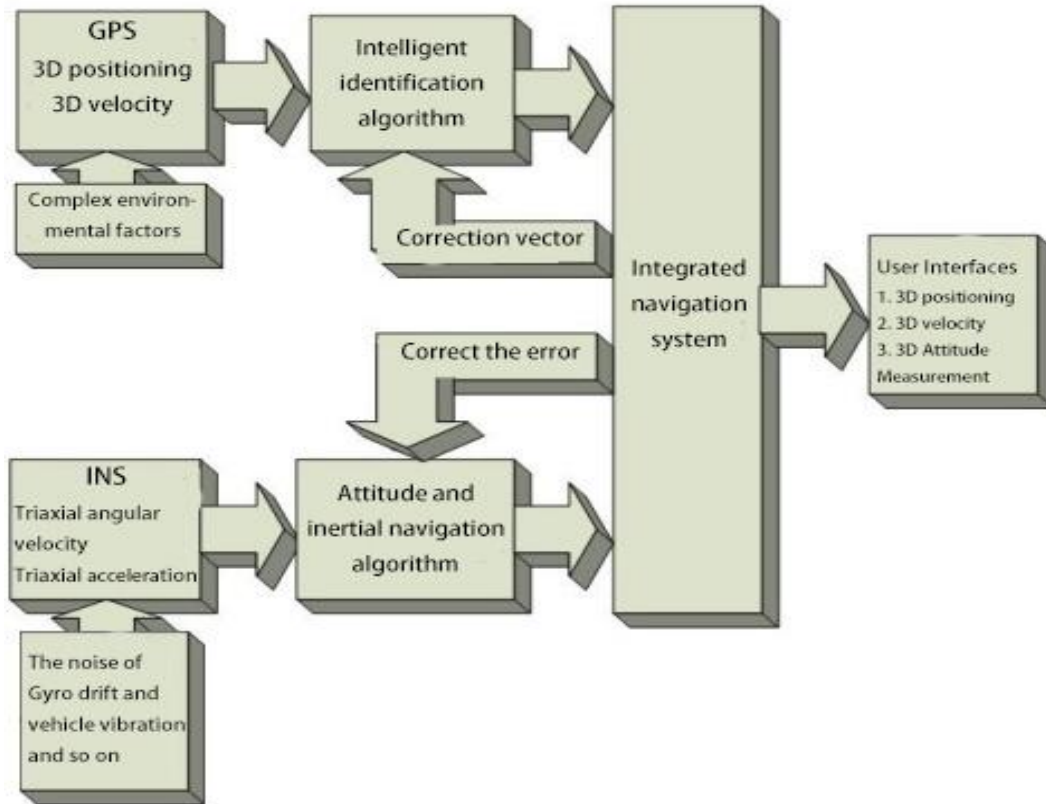

| item                       | Features   | item                     | Features   |
|----------------------------|--|--------------------------|--|
| Gyroscopic drift           | High precision attitude heading information is obtained by eliminating gyro drifttwo | Component selection      | High performance three axis gyroscope and three axis accelerometer           |
| Acceleration noise         | Eliminate vibration acceleration and obtain high accurate velocity information       | Error compensation       | Complete quadrature error / temperature drift and other error compensation   |
| Zero speed correction      | Zero speed correction algorithm prevents navigation data drift                       | Preventing pirate        | Each product calibration code is inconsistent for preventing pirate          |
| Software algorithm         | Adaptive extended Calman filtering algorithm   | Physical Dimensions      | Compact modular design saves user product space                              |
| Intelligent identification | Identify and isolate GNSS data with large errors                                     | Communication protocol   | Plug and use standard communication protocol NEMA-0183                       |
| Independent of odometer    | High precision positioning by using inertial navigation                              | Engineering installation | No installation angle, convenient for users to install on board              |
| Navigation technology      | Switch between integrated navigation and inertial navigation technology              | Sub - meter              | Support RTCM2.3 protocol / sub-meter level navigation in complex environment |

## 1.2 Technical Parameter

| Item                           | Parameter  | Specification  |
|--------------------------------|--|--|
| GNSS Receiver Type             | Channels   | 135 tracking channel and DSP accelerator<br>GPS/QZSS: L1 C/A, L5<br>GLONASS: L1OF<br>GALILEO: E1(E1B+E1C), E5A<br>BEIDOU: B1I, B2A<br>SBAS: WAAS, EGNOS, MSAS, GAGAN |
| GNSS Sensitivity               | Tracking<br>Capture<br>Re-capture                            | -167dBm<br>-149dBm<br>-161dBm  |

## 2.Application

### 2.1 Block Diagram

**Figure 1:** Block Diagram

## 2.2 System Introduction

### 2.2.1 Satellite navigation system:

Satellite navigation system has the advantages of global application, all-weather extension and high precision navigation; But satellite navigation systems are vulnerable to environmental influences, such as trees, buildings and so on, resulting in multi path effect to cause the accuracy of positioning result reduced or even lost, especially in the indoor environment, such as tunnels, satellite navigation system cannot be used.

In addition, even in an open environment, when the carrier speed is very low, the satellite navigation system will also be unable to get precise carrier azimuth information (heading angle).

### **2.2.2 Inertial navigation system:**

The inertial navigation is based on Newton's laws of mechanics to conduct integrating to time and change it into navigation coordinates by measuring the acceleration of the carrier in the inertial reference frame, thus, it can get information about speed, yaw angle, and position in navigation coordinates, as well as the carrier information. However, due to the serious drift of gyro and the shock of vehicle, the inertial navigation system can not obtain high precise azimuth and velocity information by directly integrating acceleration, that is, existing micro inertial navigation systems are difficult to work independently for a long time.

### **2.2.3 Integrated navigation system:**

Satellite / inertial integrated navigation takes full advantage of inertial navigation to obtain optimal navigation results based on the integration of optimal estimation algorithm and the kalman algorithm ; Especially when the satellite navigation system cannot work, the inertial navigation system is used to make the navigation system continue to work, to ensure the normal operation of the navigation system, and to improve the stability and reliability of the system.

### **2.2.4 Independence to odometer**

Conventional vehicle navigation systems often rely on GT-1612F5DR-AGGB schemes of odometer and gyroscopes to realize high precision navigation and positioning in complex environment of vehicle, for many automotive aftermarket, the connection of odometer signal is extreme complex, and it involves auto safety. After years of research and development, when the signal accuracy in GNSS system is reduced and even satellite signals are lost, only by using pure inertial navigation technology, the vehicle carrier can be accurately positioned, measured in a long time. Compared with the existing products on the market, the performance has been greatly improved.

Of course, the GT-1612F5DR-AGGB system can also connect with odometer signals and will achieve better performance indicators.

### **2.2.5 Vehicle attitude angle**

GT-1612F5DR-AGGB navigation system achieves filtering of gyro drift and acceleration vibration signals using research experience in MEMS inertial devices for many years by adaptive filtering algorithm, and furthermore, it can get high precision attitude information, so as to meet various needs of vehicle monitoring and navigation applications in ramp detection.

### **2.2.6 GGM navigation system**

GT-1612F5DR-AGGB navigation system provides intelligent recognition algorithm for satellite navigation accuracy to identify the positioning accuracy of satellite navigation based on the high precision navigation information provided by integrated navigation, if the satellite navigation accuracy is better, integrated navigation will be carried out, once satellite navigation signals are found to be very poor and even lost, pure inertial navigation is carried out, in a word, GT-1612F5DR-AGGB navigation system realizes autonomous switching between integrated navigation and pure inertial navigation.

## 2.3 Product feature

### 2.3.1 Maximum parameter

| Parameter         | Index        | Unit |
|-------------------|--------------|------|
| Power Supply      |              |      |
| Voltage Supply    | 3.6          | V    |
| Temperature Range |              |      |
| Operation Temp    | -40 to + 85  | °C   |
| Storage Temp      | -40 to + 125 | °C   |

### 2.3.2 Electrical feature

| Parameter                                  | Index            | Unit |
|--|------------------|------|
| Power Supply                               |                  |      |
| Input voltage                              | 2.8-3.6          | V    |
| Current                                    | 70 <sup>1)</sup> | mA   |
| Consumption                                | 300              | mW   |
| Time                                       |                  |      |
| The time required for the first valid data | <30              | S    |

## 2.4 Performance Index

### 2.4.1 Mileage timing

| GNSS signal loss time | Receiver positioning mode | Horizontal position <sup>1</sup> | Horizontal velocity <sup>1</sup> | Pitch roll Angle | Heading angle1 |
|-----------------------|---------------------------|----------------------------------|----------------------------------|------------------|----------------|
| 5 s                   | Standard                  | 1.0-2.0m                         | 0.05m/s                          | 0.3deg           | 1.0            |
|                       | Standard                  | 1.5-5.5m                         | N/A                              | N/A              | N/A            |
|                       | Standard                  | 3.0m                             | N/A                              | N/A              | N/A            |
|                       | Standard                  | 5.0m                             | 0.30m/s                          | 0.4deg           | 1.0deg         |

### 2.4.2 No Mileage Timing

| GNSS signal loss time | Receiver positioning mode | Horizontal position <sup>1</sup> | Horizontal velocity <sup>1</sup> | Pitch roll Angle | Heading angle1 |
|-----------------------|---------------------------|----------------------------------|----------------------------------|------------------|----------------|
| 5 S                   | Standard                  | 2.0-3.5m                         | 0.05m/s                          | 0.5deg           | 1.0            |
| 10 S                  | Standard                  | 10.0m                            | N/A                              | N/A              | N/A            |
| 60 S                  | Standard                  | 25.0m                            | N/A                              | N/A              | N/A            |
| 120 S                 | Standard                  | 60.0m                            | 0.5m/s                           | 1.0deg           | 2.0deg         |

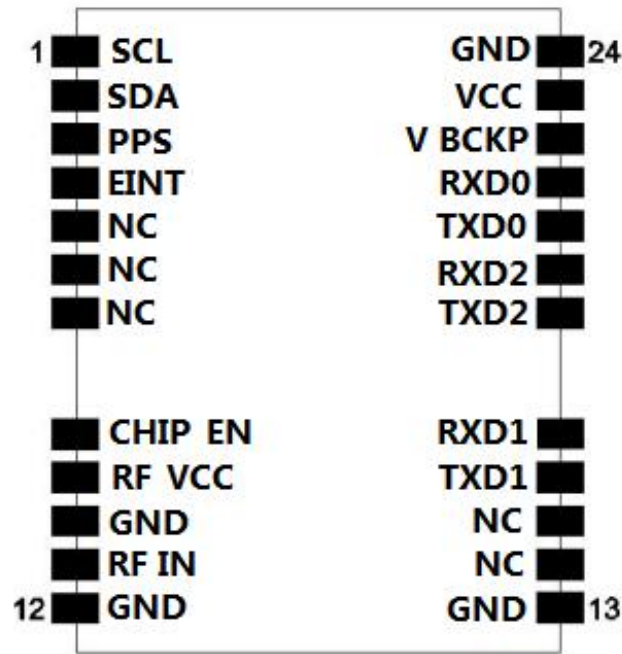

### 3. Mechanical Dimensions and Pin Assignment

3.1 This chapter describes the mechanical dimensions of the module.

**Figure2: Mechanical Dimensions (Unit: mm)**

**3.2 Pin Definition**

**Figure3: Pin Assignment**

**Table: CON Pin Description**

| Pin | Pin name | Description  | Pin | Pin name | Description                    |
|-----|----------|--|-----|----------|--------------------------------|
| 1   | SCL      | Serial Clock   | 13  | GND      | Power GND                      |
| 2   | SDA      | Serial data  | 14  | NC       |                                |
| 3   | PPS      | Pulse output(seconds)  | 15  | NC       |                                |
| 4   | EINT     | Interrupt pin, low level, suspended it when module enters dormant state & not use it | 16  | TXD1     | Reserved Debugging port (Idle) |
| 5   | NC       |  | 17  | RXD1     | Reserved Debugging port (Idle) |
| 6   | NC       |  | 18  | TXD2     | Standby serial port output     |

|    |         |  |    |        |  |
|----|---------|--|----|--------|--|
| 7  | NC      |  | 19 | RXD2   | Standby serial port input  |
| 8  | CHIP_EN | Reset; Low level reset (low level & GT; 100ms) when not in use | 20 | TXD0   | Serial port TX port  |
| 9  | RF_VCC  | Active antenna power supply                                    | 21 | RXD0   | Serial port RX port  |
| 10 | GND     | Power GND  | 22 | V_BCKP | backup battery<br>2.8V--3.3V.<br>leave it vacant when not in use |
| 11 | RF_IN   | GPS_RF Input   | 23 | VCC    | Working voltage: 2.8-3.6V<br>Recommended use: 3.3V               |
| 12 | GND     | Power GND  | 24 | GND    | Power GND  |

## 4. Coordinate System and Installation Direction

### 4.1 Attentions

As a high-performance vehicle integrated navigation system, GT-1612F5DR-AGGB system also requires users to pay attention to some matters during application.

**Figure 6: Coordinate System**

## Installation Direction

| No | Initialization process of integrated navigation  | Importance |
|----|--|------------|
| 1  | No installation Angle requirements.Refer to <b>Figure 6</b>                              |            |
| 2  | Before power on, Fixed connected GT-1612F5DR-AGGB and vehicle                            | Required   |
| 3  | After power on, don't move GT-1612F5DR-AGGB  | Required   |
| 4  | Before the vehicle moves, please make sure the GPS/BD system output the correct protocol | Required   |

| No | Initialization process of integrated navigation  | Importance |
|----|--|------------|
| 1  | After power on, make static at least 5-10 seconds to complete the attitude initialization of the navigation system;  | Required   |
| 2  | In the course of the vehicle, it is necessary to keep the GT-1612F5DR-AGGB navigation system moves in an open area for some time, for the algorithm convergence of integrated navigation system, and then test it in complex environments such as tunnels. | Required   |

### Further Explain:

Summary: In integrated navigation system initialization, it is suggested that the vehicle drive under unobstructed environment for about a few minutes, then go into obstructed environment, the positioning effect will be better .

## 5. Instructions

### 5.1 Sensor Calibration

Because the chip manufacturing process, each sensor element of GT-1612F5DR-AGGB (three axis gyroscope, three axis accelerometer), sensitivity and zero temperature drift parameters are not the same, in order to make each GT-1612F5DR-AGGB reach the same performance, before leaving the factory, various error compensation has been made for each sensor element of GT-1612F5DR-AGGB.

The calibration parameters of sensor components are different for each product, if using the same parameters, it will lead to greater navigation error. This uniqueness can be used to prevent system piracy, thereby improving the reliability of the products for users.

### 5.2 Communication interface

The GT-1612F5DR-AGGB system provides two serial ports, wherein the serial port 1 is used for transmitting satellite information and receiving differential information, and the serial port 2 is used for receiving the odometer information.

Both serial ports do not provide a hardware handshake, and the use of 8 bit data bits, 0 bit parity bit, 1 bit stop bit (8-N-1) mode, baud rate default is 9600bps, and according to user requirements, it can be modified to 115200bps.

### 5.3 Communication frequency

The system supports the output of 1hz、5hz、10Hz、20Hz data refresh frequency, the default frequency is 10HZ.

### 5.4 Communication protocol

At present, the GT-1612F5DR-AGGB system outputs common NMEA0183 protocols, such as \$GPATT,\$GNGGA,\$GNRMC,\$SPEED,\$GNGSA; in addition, in order to output vehicle attitude information, the GT-1612F5DR-AGGB system also defines a set of communication protocols GPATT.

### 5.5 Control command

GT-1612F5DR-AGGB system supports users to send control command via serial ports to achieve following functions, but, GT-1612F5DR-AGGB cannot save the setting. That means, every time the GT-1612F5DR-AGGB is powered on, it is output data by default.

**Table 1 :** Inertial navigation enabling

| type | attribute   | communication protocol    | default value | Remarks                                |
|------|-------------|---------------------------|---------------|--|
| 1    | log gpins   | Open inertial navigation  | Default       | For results, please see protocol GPATT |
| 2    | unlog gpins | Close inertial navigation |               |  |

**Table 2:** Output frequency setting

|------|-------------|------------------------|---------------|---|
| 4    | log g4800   | Set as 4800            |               | For results, please see output protocol |
| 5    | log g9600   | Set as 9600            | Default 1     | For results, please see output protocol |
| 6    | log g1920   | Set as 19200           |               | For results, please see output protocol |
| 7    | log g3840   | Set as 38400           |               | For results, please see output protocol |
| 8    | log g115200 | Set as 115200          | Default 2     | For results, please see output protocol |

**Remarks:**

- (1) All instructions are lowercase letters;
- (2) There is a space key behind Log and unlog;
- (3) GPATT protocol contains a lot of product information, it is recommended that users retain the output of the protocol to facilitate query problems;
- (4) GPGSV, GPGSA take serial port resources, and, it is recommended that users to close two groups of protocols when using the inertial navigation function;
- (5) GT-1612F5DR-AGGB has two default baud rates 9600bps/115200bps. Please specify the baud rate required when make ordering.
- (6) The specific details of required execution time for GT-1612F5DR-AGGB to execute various user commands are shown in following table. If the user sends a command, please make sure that the command is executed.

| No | Command type                 | required time |
|----|------------------------------|---------------|
| 1  | Inertial navigation enabling | 20ms          |
| 2  | Output frequency setting     | 20ms          |
| 3  | ATT protocol enabling        | 20ms          |
| 4  | ZDA protocol enabling        | 20ms          |
| 5  | GSV protocol enabling        | 500ms         |
| 6  | Choose BD/Glonass            | 500ms         |
| 7  | Baud rate setting            | 20ms          |

## 6. NMEA Data Analysis

The communication statements specified in the NMEA protocol are based on ASCII coding, the data format of the NMEA-0183 protocol statement is as follows: "\$" is the statement start symbol; "," is the domain delimiter; "\*" is the checksum identifier, the two digits behind it are checksum, which represent the bitwise XOR value of all characters between (\$) and \* (excluding these two characters); "/" is the terminator, all statements must end using it, that is, the ASCII character "return" (hexadecimal 0D) and "line feed" (hexadecimal 0A).

The default output NMEA data of GT-1612F1DR-AGGB is \$GPATT,\$GNGGA, \$GNRMC,\$SPEED,\$GNGSA and users can also specify the output data according to personal needs.

### 6.1 GGA Data Format

For Example : \$GNGGA,062938.00,3110.4700719,N,12123.2657056,E,1,25,0.6,58.9666,M,0.000,M,99,AAAA\*50

| No | Name          | Description  | Code          | Example       |
|----|---------------|--|---------------|---------------|
| 1  | \$GNGGA       | Log header   |               | \$GNGGA       |
| 2  | utc           | UTC time (H/M/S)   | hhmmss.ss     | 202134.00     |
| 3  | lat           | Latitude: -90~90 degrees   | lll.llllll    | 3110.4693903  |
| 4  | latdir        | Latitude direction: N: North; S: South   | a             | N             |
| 5  | lon           | Longitude: -180~180 degrees  | yyyyy.yyyyyyy | 12123.2621695 |
| 6  | londir        | Longitude direction: E: east; W: west  | b             | W             |
| 7  | QF            | Solution State<br>0: invalid solution;<br>1: single point positioning solution;<br>2: pseudo range difference;<br>6: inertial navigation | q             | 1             |
| 8  | sat No.       | Satellite Number   | n             | 14            |
| 9  | GPS precision | GPS precision  | x.x           | 0.6           |
| 10 | alt           | Altitude   | h.h           | 50.22         |
| 11 | a-units       | Altitude unit  | M             | M             |
| 14 | age           | Differential delay   | dd            | 1             |
| 15 | stn ID        | Base station number: 0000-1023,<br>In single: AAAA   | xxxx          | 1             |
| 16 | *xx           | Checksum   | *hh           |               |
| 17 | [CR][LF]      | Sentence terminator  |               | [CR][LF]      |

### 6.2 RMC Data Format

For Example : \$GNRMC,064401.65,A,3110.4706987,N,12123.2653375,E,0.604,243.2,300713,0.0,W,A\*3E

| No | Name       | Description   | code          | Example       |
|----|------------|---|---------------|---------------|
| 1  | \$GNRMC    | Log header  |               | \$GNRMC       |
| 2  | utc        | UTC time (H/M/S)  | hhmmss.ss     | 143550.00     |
| 3  | Pos status | Solution state:<br>A= effective positioning<br>V= invalid positioning | A             | A             |
| 4  | lat        | Latitude: -90~90 degrees  | lll.llllll    | 3110.4854911  |
| 5  | latdir     | Latitude direction: N: North; S: South                                | a             | N             |
| 6  | lon        | Longitude: -180~180 degrees   | yyyyy.yyyyyyy | 12123.9129278 |
| 7  | londir     | Longitude direction: E: east; W: west                                 | b             | E             |
| 8  | SPEED IN   | Ground speed  | q             | 0.29          |

|    |            |   |        |          |
|----|------------|---|--------|----------|
| 9  | Track Ture | Ground course angle   | n      | 108.5    |
| 10 | Date       | UTC date  | ddmmyy | 010909   |
| 11 | Mag var    | Magnetic declination (000.0~180.0 degrees, adding o if lack of leading digit)   | 0.0    | 0.0      |
| 12 | Vardir     | Declination direction, E (East) or W (West)   | M      | M        |
| 13 | Mode ind   | Mode indication (only NMEA0183 3 version output, A= self localization, D= difference, E= estimation, N= data invalid) | a      | A        |
| 14 | *xx        | Checksum  | *hh    | *57      |
| 15 | [CR][LF]   | Sentence terminator   |        | [CR][LF] |

✧ After the inertial navigation module is powered on, the installation Angle is the installation Angle identified by the previous module. If there is a big difference between the current installation Angle and the last installation Angle, it is recommended to clear it by sending the command log clear. The inertial navigation derivation should be avoided due to the error of installation Angle.

### 6.3 ATT Data Format

For Example :

```
$GPATT,1.05,p,1.72,r,179.41,y,20220625,S,003E009,ID,1,INS,3335,04,20,-1.61,2,7,01,1.20,4,1,D,00,7,1,56.299,0,0,04,B,-3,-3,-1,5,2,2,F,0*0F
```

| No | Name            | Description                      | Code     | Example              |

**Remarks : the conditions for inertial navigation to work normally:**

- 1.GPATT protocol 12 field INS is 1
- 2.GPATT protocol 15 field State Flag is 03/04

If the user wants to obtain good inertia performance, such as speed, UBI alarm and other parameters, In addition to the above two results, it is recommended to wait for inertial navigation convergence. As the (1) Table A and Table B shows

(1) GPATT protocol 31 field Run\_Inetial\_Flag is 4;

**Table A GPATT protocol 15 field RUN\_STATE\_FLAG each physical meaning description**

| Flag | description   | Required conditions                    |
|------|---|--|
| 0    | Prepare initialization                                      | System power on                        |
| 1    | Attitude initialization completed                           | Vehicle Static for 5-10S               |
| 2    | Position initialization completed                           | Get Position Info                      |
| 3    | Get the installation angle, Enter the integrated navigation | Driving over 5m/s for a period of time |
| 4    | The installation Angle has been identified                  | Keep driving for a while               |

**Table B GPATT protocol 31 field Run\_Inetial\_Flag each physical meaning description**

| Flag | description                                | Required conditions                                       |

✧ **Remarks :**

- (1) The speed unit of SPEED protocol is the same as that of GNRMC
- (2) The output frequency of SPEED protocol is 10Hz
- (3) Since the inertial navigation system supports arbitrary installation, the value of the sensor can be converted to the vehicle coordinate system only after the installation Angle is determined, so as to obtain the acceleration and angular velocity data of X/Y/Z axis. Otherwise, the inertial sensor data will be installed arbitrarily, resulting in the data cannot be converted to the vehicle's XYZ axis.

Initialization under adaptive installation: The inertial navigation module must be rigidly linked to the vehicle. Then, there are two situations:

Situation 1: If it is installed for the first time, when the inertial navigation module is powered on, there is no installation Angle in the Flash, then the Status value is 0. After the vehicle runs, through the vehicle acceleration deceleration and other vehicle movement, it identifies the installation Angle, then Status will change to 1, and it will change to 2 about 3 minutes after the vehicle runs again and the inertial navigation training is completed. In this case, acceleration and angular velocity are reliable values.

Situation 2: If it is not the first installation, after the inertial navigation module is powered on, there is already an installation Angle in the Flash, and the value of Status is 1. The vehicle runs for about 3 minutes again, and the Status changes to 2 after the inertial navigation training is completed. In this case, acceleration and angular velocity are reliable values.

(4) The unit of angular velocity is radian per second, if converted to degrees per second, please multiply by the coefficient 180/3.14;

**Table L: SPEED Log header 13 field UBI\_State\_Kind 和 UBI\_State\_Kind Description**

| UBI_State_Kind[1] | Domain Status              | UBI_State_Value[2] | Data source [3]     | default | unite |
|-------------------|----------------------------|--------------------|---------------------|---------|-------|
| 0                 | Normal driving condition   | 0                  |                     |         |       |
| 1                 | Ordinary acceleration      | YZ_Acce_Peta       | BS_Acce_Peta/10.0   | 1.2     | m/s/s |
| 2                 | rapid acceleration         | YZ_Acce_Deta       | BS_Acce_Deta/10.0   | 1.6     | m/s/s |
| 3                 | Ordinary decelerate        | YZ_Dcce_Peta       | BS_Dcce_Peta/10.0   | -2.2    | m/s/s |
| 4                 | abrupt deceleration        | YZ_Dcce_Deta       | BS_Dcce_Deta/10.0   | -3.2    | m/s/s |
| 5                 | abrupt change lane         | YZ_Lane_Deta       | BJ_Y_Lane_Deta/10.0 | 1.2     | m/s/s |
| 6                 | Normal turning             | YZ_Rate_Peta       | BS_Turn_Deta/10.0   | 2.2     | d/s   |
| 7                 | Abrupt turning             | YZ_Rate_Deta       | BS_Turn_Deta*4/10.0 | 8.8     | d/s   |
| 8                 | Abnormal posture condition | YZ_Atti_Deta       | BJ_Att_Min_D        | 10      | d     |

**Note 1:**

- (1) When UBI\_State\_Kind value is 1,2,3, and 4, the state is obtained by comparing the vertical axis acceleration with the UBI\_State\_Value threshold value;
- (2) When the UBI\_State\_Kind value is 5, the state is obtained by comparing the horizontal axis acceleration with the UBI\_State\_Value threshold value;
- (3) When the UBI\_State\_Kind value is 6 or 7, the state is obtained by comparing the vertical angular velocity with the UBI\_State\_Value threshold value;
- (4) When the UBI\_State\_Kind value is 8, the state is obtained by comparing the pitch Angle and roll Angle with the UBI\_State\_Value threshold value;

**Note 2:**

UBI\_State\_Value indicates that the acceleration unit of the acceleration threshold is consistent with that of SPEED, and the angular velocity threshold is inconsistent with that of SPEED.
